

Updating Wireless Drivers (Windows)

If a Windows machine cannot connect to AirBear, the first thing to check (after verifying that their password is working elsewhere), is to update the wireless drivers.

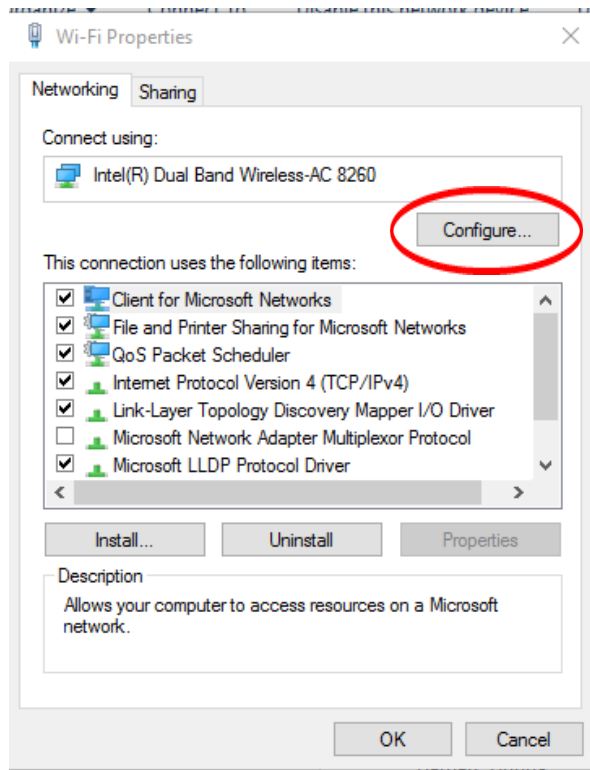

Go to the Network and Sharing Center Control Panel. Click on “Change adapter settings”.

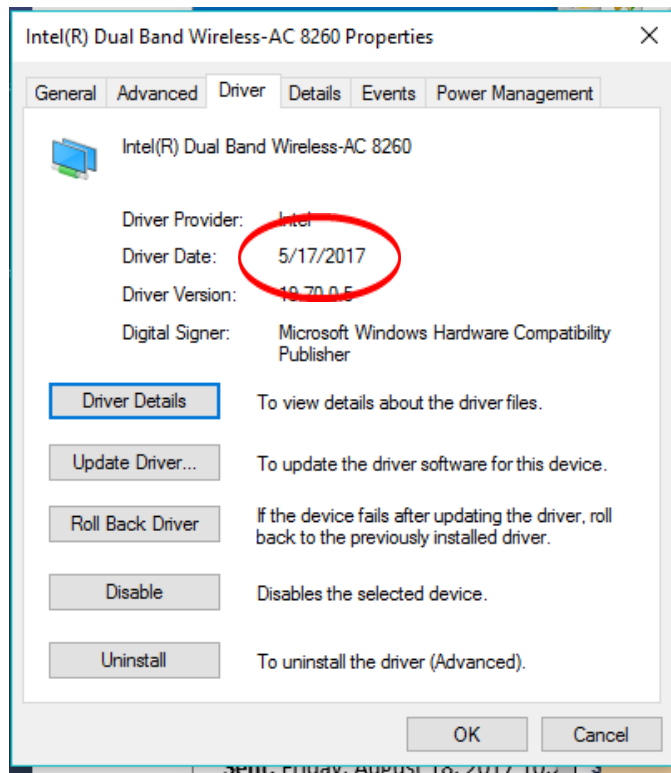

In the next window, right-click on the Wi-Fi icon and select **Properties**.

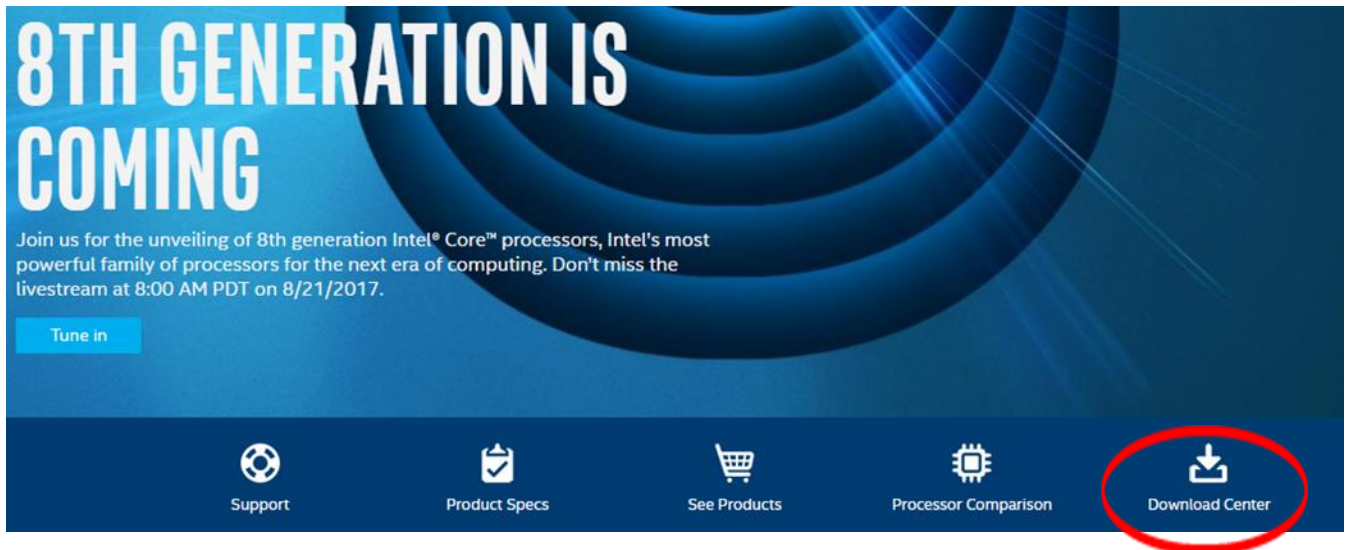

Click on the **Configure** button.

Click on the **Driver** tab and note the Driver Date. If the date is not current (more than a year old), you should download an updated driver.

Go to: www.intel.com and click on the “Download Center”.

Locate the “Wireless Networking” section and click on the appropriate version of your Windows operating system.

Follow the instruction to download and install the new driver. If you have any questions, please contact the Help Desk at 254-710-4357.
